

1. Ideation Phase

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Project concept, problem statement, user story and objectives

1.1 Project Overview

The project focuses on streamlining standard laptop procurement by automating the creation and assignment of configuration tasks using ServiceNow Flow Designer.

The intended outcome is that, after a standard laptop request is approved, a catalog task is created and assigned to the Hardware group so the laptop can be configured promptly.

1.2 Problem Statement

The existing IT procurement process can involve delays and manual overhead, particularly for standard laptop orders. Configuration steps may be overlooked or delayed, causing user frustration and inefficient use of IT resources.

1.3 User Story

As a member of the IT procurement team, I want a streamlined process for ordering standard laptops so that tasks are automatically generated and assigned to the Hardware team for configuration. This helps ensure laptops are configured promptly upon arrival, reduces user waiting time, and minimises manual intervention.

1.4 Project Objectives

- Provide a smoother experience for users requesting standard laptops.
- Reduce manual work and potential errors in the procurement process.
- Improve IT resource utilisation through more appropriate task allocation.
- Increase efficiency and productivity in IT procurement operations.

1.5 Proposed Idea

Create a ServiceNow Flow Designer flow named **Standard Laptop Task**. Use the Service Catalog trigger and the **Create Catalog Task** action to create a configuration task, set the short description and description, assign it to Hardware, and set approval to Approved as described in the reference document.

1.6 Expected Result

When a Standard Laptop catalog request is submitted and approved, the workflow should create a catalog task with the specified laptop-configuration details and Hardware assignment. The result can be checked through the requested item's Catalog Tasks section.
