

2. Requirement Analysis

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Functional requirements, system setup and expected workflow behaviour

2.1 Purpose

This phase identifies what the automated standard laptop ordering workflow must do, based on the supplied project reference.

2.2 Functional Requirements

- The flow must be created in ServiceNow Flow Designer.
- The flow name must be "Standard Laptop Task".
- The application must be Global and the Run As setting must be System user.
- The flow must use the Service Catalog trigger.
- The flow must use the Create Catalog Task action.
- The Requested Item record must be mapped to the Request item field.
- The target table must populate as Catalog Task.
- The short description must be "Laptop need to Configured".
- The description field must be set to "Laptop need to Configured".
- The Assignment group must be Hardware.
- The Approval field must be Approved.
- The flow must be saved, activated, and assigned to the Standard Laptop catalog item.

2.3 Platform and Components

Component	Requirement / use
ServiceNow	Platform used to configure the service catalog and automation.
Flow Designer	Used to create and activate the workflow.
Service Catalog trigger	Starts the flow from the catalog request process.
Create Catalog Task action	Creates the task for laptop configuration.
Hardware assignment group	Receives the configuration task.
Standard Laptop catalog item	Catalog item to which the flow is assigned.

2.4 Non-Functional Goals

- Efficiency: reduce manual steps and avoid unnecessary delays.
- Consistency: use the same task description and assignment for standard laptop requests.
- Usability: provide a straightforward request and approval path through the Service Catalog.
- Traceability: allow the created catalog task and its status to be checked from the requested item.

2.5 Acceptance Checks

- The Standard Laptop item is linked to the Standard Laptop Task flow.
- After a request is approved, a catalog task is created.
- The task shows the expected short description and Hardware assignment group.
- The task can be opened from the Requested Item record under Catalog Tasks.

2.6 Scope Note

The source document specifies the workflow fields and setup steps above. It does not specify service-level targets, security roles, testing data, or performance thresholds; these are therefore not defined as requirements in this document.
